Python online test questions and answers

Free Coding Exercises for Python Developers. These exercises cover a wide range of topics, including Python Basics, Data structures, and Data Analytics, with over 200 exercises available. Given article text here To solve the exercises for intermediate developers, practice each topic in detail by completing the provided questions. This will help you understand and master each concept. A dictionary emp_dict is provided with nested keys: "company", "employee", and "payable". The innermost key, "increment", holds the value 12. To access this key, one must navigate through the dictionary using the print function. This can be achieved by specifying each key in sequence: 'company', 'employee', 'payable', and finally 'increment'.
